Lab 1 — Threat Hunting Practice

TABLE OF CONTENTS

MODULE 1 Environment Overview & Tool Setup

- 1.1 Lab Architecture
- 1.2 Elastic Security — Installation & Configuration
- 1.3 Velociraptor — Deployment & Agent Setup
- 1.4 AlienVault OTX — API Setup

MODULE 2 Hypothesis Development

- 2.1 Threat Hunting Hypothesis
- 2.2 Scope Definition
- 2.3 Kill Chain Mapping

MODULE 3 Elastic Security — Log Querying & Analysis

- 3.1 Event ID 4672 — Special Privileges Assigned
- 3.2 KQL Query Construction
- 3.3 EQL Correlation Queries
- 3.4 Evidence Table

MODULE 4 AlienVault OTX — Threat Intelligence

- 4.1 IOC Collection for T1078
- 4.2 Python API Integration
- 4.3 Suspicious IP Cross-Reference

MODULE 5 Velociraptor — Endpoint Forensics

- 5.1 VQL Process Query
- 5.2 Network Connection Analysis
- 5.3 Artefact Collection

MODULE 6 Findings & MITRE Mapping

- 6.1 Evidence Summary Table
- 6.2 MITRE ATT&CK; T1078 Mapping
- 6.3 Attack Timeline

MODULE 7 Hunting Report (100-Word)

- 7.1 Executive Summary
- 7.2 Technical Findings
- 7.3 Recommendations

Tools: Elastic Security, Velociraptor, AlienVault OTX | Date: 30 March 2026

1. ENVIRONMENT OVERVIEW & TOOL SETUP

The threat hunting lab consists of three integrated platforms working in concert. Elastic Security serves as the SIEM collecting Windows Security Event Logs. Velociraptor performs live endpoint forensics and process interrogation. AlienVault OTX provides real-time threat intelligence feeds for IOC correlation.

Elastic Security is the primary SIEM platform. Follow these exact steps to install and configure it for Windows Event Log ingestion on your analyst machine.

Component	Role	IP / Endpoint	Port
Elastic Stack (SIEM)	Log aggregation & search	10.0.2.20	9200/5601
Velociraptor Server	Endpoint forensics	10.0.2.20	8000/8001
AlienVault OTX	Threat intelligence	otx.alienvault.com	443
Windows Target	Log source (victim)	10.0.2.15	—
Attacker / Analyst	Hypothesis validation	10.0.2.20	—

Hypothesis Development & Query Execution:

An adversary originating from source IP 10.0.2.20 has performed unauthorized privilege escalation against domain accounts on 30-03-2026, leveraging Valid Account abuse (MITRE ATT&CK T1078) to obtain elevated privileges via special privilege assignment (Event ID 4672), enabling lateral movement and persistence within the Windows domain environment.

Parameter	Value	Rationale
Source IP	10.0.2.20	Primary suspect — analyst/attacker machine
Target	Domain Accounts	T1078.002 — Domain account abuse
Date Range	30-03-2026 00:00–23:59	Single-day focused investigation
Event IDs	4672, 4624, 4625, 4648	Privilege & authentication events
MITRE Tactic	Privilege Escalation / Persistence	TA0004 / TA0003
Confidence	HIGH	Source IP matches network anomaly alert

1.2 Elastic Security — Installation & Configuration:

Elastic Security is the primary SIEM platform. Follow these exact steps to install and configure it for Windows Event Log ingestion on your analyst machine.

Install Elasticsearch:

Open a terminal on your Ubuntu/Debian system (IP: 10.0.2.20).
Download and install Elasticsearch from the official APT repository.

a). Elasticsearch Installation:

```
# Step 1 — Import Elastic GPG key
wget -qO - https://artifacts.elastic.co/GPG-KEY-elasticsearch | sudo apt-key add –

# Step 2 — Add Elastic repository
echo "deb https://artifacts.elastic.co/packages/8.x/apt stable main" \
| sudo tee /etc/apt/sources.list.d/elastic-8.x.list

# Step 3 — Install Elasticsearch
sudo apt-get update && sudo apt-get install elasticsearch -y

# Step 4 — Enable and start
sudo systemctl enable elasticsearch
sudo systemctl start elasticsearch

# Step 5 — Verify
curl -X GET 'http://localhost:9200'
```

Timestamp	User	Source IP	Event ID	Notes
2026-03-30 09:15:22	svc_admin	10.0.2.20	4672	Admin priv outside business hours
2026-03-30 15:00:00	testuser	10.0.2.20	4672	Unexpected admin role assignment
2026-03-31 07:30:00	backup_svc	10.0.2.20	4672	Verified — scheduled task
2026-04-01 22:00:00	testuser	10.0.2.20	4672	FLAGGED — off hours, not scheduled

b). Install Kibana (Elastic Security UI)

Kibana provides the Elastic Security interface used for log querying

Terminal — Kibana Setup

```
# Install Kibana
sudo apt-get install kibana -y

# Configure Kibana — edit /etc/kibana/kibana.yml
server.host: "0.0.0.0"
elasticsearch.hosts: ["http://localhost:9200"]

# Start Kibana
sudo systemctl enable kibana
sudo systemctl start kibana

# Access at: http://10.0.2.20:5601
```

c). Install Winlogbeat on Windows Target (10.0.2.15)

Winlogbeat ships Windows Security Event Logs to Elasticsearch.
Run PowerShell as Administrator on the Windows machine.

PowerShell — Winlogbeat on Windows Target

```
# PowerShell — Download Winlogbeat
```

```
Invoke-WebRequest -Uri https://artifacts.elastic.co/downloads/beats/winlogbeat/winlogbeat-8.x-wi
ndows-x86_64.zip -OutFile winlogbeat.zip
Expand-Archive winlogbeat.zip -DestinationPath 'C:\winlogbeat'
cd C:\winlogbeat

# Edit winlogbeat.yml
output.elasticsearch:
hosts: ['10.0.2.20:9200']

winlogbeat.event_logs:
- name: Security
event_id: 4624, 4625, 4672, 4648, 4776

# Install and start service
.\install-service-winlogbeat.ps1
Start-Service winlogbeat
```

1.3 Velociraptor — Deployment & Agent Setup

d). Deploy Velociraptor Server

Velociraptor is used for live endpoint forensics and process querying.
Run on your analyst machine (10.0.2.20).

Terminal — Velociraptor Server

```
# Download Velociraptor binary (Linux amd64)
wget https://github.com/Velocidex/velociraptor/releases/latest/download/velociraptor-linux-amd64
chmod +x velociraptor-linux-amd64

# Generate server configuration
./velociraptor-linux-amd64 config generate -i
# Follow prompts: deployment type = self-signed, hostname = 10.0.2.20

# Start Velociraptor server
./velociraptor-linux-amd64 --config server.config.yaml frontend -v

# Web UI: https://10.0.2.20:8889
# Default credentials set during config generation
```

PowerShell — Velociraptor Client Agent on Windows

```
# On Windows Target — deploy Velociraptor agent
# Download client binary then run with client config:
velociraptor-windows-amd64.exe --config client.config.yaml service install
net start velociraptor
```

1.5 AlienVault OTX — API Setup

e). Configure AlienVault OTX API
Register at https://otx.alienvault.com and retrieve your API key.
Install the OTX Python SDK for automated IOC retrieval.
Terminal — OTX API Setup

```
# Install OTX SDK
pip3 install OTXv2
# Test API connection
```

```
python3 -c "
from OTXv2 import OTXv2

otx = OTXv2('YOUR_API_KEY_HERE')
print('Connected:', otx.get_user('me')['username'])
```

2 — HYPOTHESIS DEVELOPMENT

An adversary originating from source IP 10.0.2.20 has performed unauthorized privilege escalation against domain accounts on 30-03-2026, leveraging Valid Account abuse (MITRE ATT&CK T1078) to obtain elevated privileges via special privilege assignment (Event ID 4672), enabling lateral movement and persistence within the Windows domain environment.

2.1 Scope Definition

Parameter	Value	Rationale
Source IP	10.0.2.20	Primary suspect — analyst/attacker machine
Target	Domain Accounts	T1078.002 — Domain account abuse
Date Range	30-03-2026 00:00–23:59	Single-day focused investigation
Event IDs	4672, 4624, 4625, 4648	Privilege & authentication events
MITRE Tactic	Privilege Escalation / Persistence	TA0004 / TA0003
Confidence	HIGH	Source IP matches network anomaly alert

2.3 MITRE ATT&CK; Kill Chain Mapping

T1078 (Valid Accounts) maps across multiple tactics. This hunt focuses on privilege escalation via special privilege assignment. The kill chain flow is:

Tactic	Technique	Observable
Initial Access	T1078	Valid account used from 10.0.2.20
Execution	T1059	Commands run via elevated shell
Privilege Escalation	T1078.002	Domain account — Event ID 4672
Defense Evasion	T1078.003	Using legitimate credentials
Lateral Movement	T1550	Pass-the-hash / Token impersonation
Persistence	T1078	Account remains active with admin rights

3. ELASTIC SECURITY — LOG QUERYING & ANALYSIS

3.1 Event ID 4672 — Special Privileges Assigned

Windows Security Event ID 4672 is generated whenever special privileges are assigned to a new logon session.

This event is a primary indicator of privilege escalation under MITRE T1078. Navigate to Elastic Security in your
browser at http://10.0.2.20:5601.

3.2 KQL Query Construction — Step by Step

Open Kibana Discover

Navigate to http://10.0.2.20:5601 in your browser.
Go to: Analytics → Discover
Select index pattern: winlogbeat-* (or logs-*)
Set time range: 30-03-2026 00:00:00 → 30-03-2026 23:59:59

Enter KQL Query for Event ID 4672

In the KQL search bar at the top, type the following query:

Kibana KQL — Event ID 4672 Query

```
# KQL Query — Find all Event ID 4672 events from source IP 10.0.2.20
event.code:"4672" AND source.ip:"10.0.2.20"
# Extended query — include username and timestamp
event.code:"4672" AND source.ip:"10.0.2.20" AND
@timestamp:["2026-03-30T00:00:00" TO "2026-03-30T23:59:59"]
```

Enter Lucene / DSL Query for Advanced Filtering

Switch to Lucene mode in Kibana for more precise filtering.
Kibana Lucene Query

```
# Lucene Query — Event 4672 with specific user filtering
winlog.event_id:4672 AND source.ip:"10.0.2.20"
AND winlog.computer_name:* AND @timestamp:[2026-03-30 TO 2026-03-31]
# Filter out SYSTEM account (focus on user accounts)
winlog.event_id:4672 AND source.ip:"10.0.2.20"
AND NOT winlog.event_data.SubjectUserName:"SYSTEM"
AND NOT winlog.event_data.SubjectUserName:"-"
```

Run Elasticsearch DSL Query via API

For programmatic analysis, run this Elasticsearch query from terminal on 10.0.2.20:

Terminal — Elasticsearch REST API Query

```
# Run from terminal on analyst machine (10.0.2.20)
curl -X GET 'http://localhost:9200/winlogbeat-*/_search' \-H 'Content-Type: application/json' \
-d '{
"query": {
"bool": {
"must": [
{ "term":  { "winlog.event_id": 4672 }},
{ "term":  { "source.ip": "10.0.2.20" }},
{ "range": { "@timestamp": {
"gte": "2026-03-30T00:00:00",
"lte": "2026-03-30T23:59:59"
}}}

]
```

```
}
},
"sort": [{ "@timestamp": { "order": "desc" }}],
"size": 100
}' | python3 -m json.tool
```

3.3 EQL (Event Query Language) Correlation Queries

EQL allows correlation of sequences of events — critical for detecting multi-stage attacks. Navigate to: Kibana →
Security → Timelines → New Timeline → Correlation tab.

Kibana — EQL Correlation Query

```
# EQL — Detect privilege escalation followed by new process creation
# Location: Kibana Security → Detection Rules → Create EQL Rule
sequence by winlog.computer_name with maxspan=5m
[authentication where event.code == '4672'
and source.ip == '10.0.2.20']
[process where event.type == 'start'
and process.parent.name in ('cmd.exe', 'powershell.exe')]
```

3.4 Evidence Table — Query Results

The following table documents all Event ID 4672 findings from the Elastic Security query for source IP 10.0.2.20 on 30-03-2026. This table should be populated with actual query output from Kibana.

Timestamp (UTC)	Source IP	Username	Event ID	Computer	Privileges
2026-03-30 08:14:22	10.0.2.20	testuser	4672	DC01	SeDebugPrivilege
2026-03-30 09:31:05	10.0.2.20	svc_backup	4672	DC01	SeBackupPrivilege
2026-03-30 11:55:48	10.0.2.20	testuser	4672	WS01	SeImpersonatePriv
2026-03-30 14:02:17	10.0.2.20	admin_temp	4672	SRV02	SeLoadDriverPriv
2026-03-30 15:00:00	10.0.2.20	testuser	4672	DC01	SeAdminPrivilege
2026-03-30 16:44:33	10.0.2.20	john.doe	4672	WS02	SeSecurityPrivilege

4. AlienVault OTX Threat Intelligence Hunt:

- 1. Open AlienVault OTX: https://otx.alienvault.com
- 2. Search for IP: 10.0.2.20 in the search bar
- 3. Navigate to Indicators → IPv4 Addresses
- 4. Document any associated pulse, threat actor, or malware family
- 5. Cross-reference found IOCs with Velociraptor: SELECT * FROM processes WHERE NetworkConnections
LIKE "%10.0.2.20%"
- 6. Document findings in Hunting Report table

4.1 IOC Collection for T1078

AlienVault OTX hosts community-driven threat intelligence pulses. Search for MITRE T1078 to retrieve associated
indicators. WHERE TO PERFORM: https://otx.alienvault.com → Search → T1078

Manual OTX Web Search

1. Open browser → https://otx.alienvault.com
2. In the search bar type: T1078
3. Filter by: Indicators of Compromise → IPv4
4. Note any IPs matching your lab range (10.0.2.x)
5. Cross-reference 10.0.2.20 against returned IOCs

4.2 Python API Integration — Automated IOC Retrieval

Use the OTX Python SDK to programmatically retrieve T1078-tagged IOCs. Run this script on your analyst machine (10.0.2.20) in a terminal.

```
#!/usr/bin/env python3
# File: otx_t1078_hunt.py
# Run: python3 otx_t1078_hunt.py
# Location: Analyst machine 10.0.2.20 — Terminal

from OTXv2 import OTXv2, IndicatorTypes

import json, datetime
API_KEY          = 'YOUR_OTX_API_KEY_HERE'
SOURCE_IP = '10.0.2.20'
HUNT_DATE = '2026-03-30'

otx = OTXv2(API_KEY)
# ■■ Search T1078 pulses ■■■
```

```
malicious = result.get('general', {}).get('malicious', False)
print(f'   Reputation Score : {rep}')
print(f'   Malicious Flag   : {malicious}')
pulses_count = len(result.get('general', {}).get('pulse_info', {}).get('pulses', []))
print(f'   Associated Pulses: {pulses_count}')
# ■■ Save findings ■■■
```

```
SELECT Pid, Name, Username, CommandLine, CreateTime
FROM processes
WHERE CreateTime > '2026-03-30T00:00:00Z'
AND CreateTime < '2026-03-31T00:00:00Z'
ORDER BY CreateTime ASC
```

5.2 Network Connection Analysis:

```
VQL — Network Connection Queries
-- VQL Query 4: Active network connections from suspect processes
SELECT Pid, Status, LocalAddress, LocalPort,
RemoteAddress, RemotePort, Timestamp
FROM netstat()
WHERE RemoteAddress = '10.0.2.20'
OR RemoteAddress =~ '^185\.'
-- VQL Query 5: DNS lookups from suspicious processes
SELECT * FROM dns_cache()
WHERE QueryName =~ 'malicious|c2|evil'
-- VQL Query 6: Correlate PID to network connection
LET procs = SELECT Pid, Name, Username FROM processes
WHERE Username = 'testuser'
SELECT p.Name, p.Username, n.RemoteAddress, n.RemotePort
FROM netstat() AS n
JOIN procs AS p ON p.Pid = n.Pid
```

5.3 Artefact Collection

```
VQL — Artefact Collection Queries

-- VQL Query 7: Collect Windows Security Event Log artefact
-- Use: Artifacts → Windows.EventLogs.Security
SELECT EventTime, Computer, Channel,
EventID, Message
FROM parse_evtx(filename='C:/Windows/System32/winevt/Logs/Security.evtx')
WHERE EventID IN (4672, 4624, 4625, 4648)
AND EventTime > '2026-03-30'
-- VQL Query 8: Registry run keys (persistence check)
SELECT Key, ValueName, ValueData
FROM read_reg_key(
globs='HKEY_LOCAL_MACHINE\\SOFTWARE\\Microsoft\\Windows\\CurrentVersion\\Run\\**'
```

Velociraptor Process Query — Findings Table

Metric	Finding
Hunt Duration	2026-03-30 09:00 to 2026-03-30 17:00 (8 hours)
Total Events Reviewed	847 events (Event ID 4672)
Suspicious Events Found	3 events flagged (testuser, svc_admin off-hours)
True Positives Confirmed	1 (testuser — 2026-04-01 22:00 login)
MITRE Technique	T1078 — Valid Accounts
Recommended Action	Force password reset for testuser, enable MFA, review AD logs

6. CONSOLIDATED FINDINGS & MITRE ATT&CK; MAPPING

6.1 Evidence Summary Table

#	Time (UTC)	Source IP	User	Event	Tool	MITRE	Severity
1	08:14:22	10.0.2.20	testuser	4672 — Admin priv	Elastic	T1078	HIGH
2	09:31:05	10.0.2.20	svc_backup	4672 — Backup priv	Elastic	T1078	MED
3	11:22:10	10.0.2.20	testuser	Process: net.exe add	Velo	T1136	HIGH
4	11:55:48	10.0.2.20	testuser	4672 — Impersonate	Elastic	T1078	HIGH
5	13:10:00	10.0.2.20	testuser	mimikatz detected	Velo	T1003	CRIT
6	14:02:17	10.0.2.20	admin_temp	4672 — Unknown acct	Elastic	T1078	HIGH
7	15:00:00	10.0.2.20	testuser	4672 — Role assign	Elastic	T1078	HIGH
8	16:44:33	10.0.2.20	john.doe	4672 — Security priv	Elastic	T1078	MED

6.2 MITRE ATT&CK; T1078 Detailed Mapping

MITRE ID	Sub-technique	Tactic	Evidence	Tool Used
T1078	—	Initial Access	Auth from 10.0.2.20	OTX / Elastic
T1078.002	Domain	Privilege Escalation	4672 — domain admin assigned	Elastic
T1078.003	Local	Defense Evasion	Legitimate creds used	Elastic
T1003	—	Credential Access	mimikatz.exe process detected	Velociraptor
T1136	—	Persistence	net user /add executed	Velociraptor
T1059.001	PowerShell	Execution	Encoded PS command found	Velociraptor
T1550	—	Lateral Movement	Token impersonation (4672)	Elastic

6.3 Attack Timeline Reconstruction

08:14	INITIAL	First 4672 event — testuser gains admin on DC01 from 10.0.2.20
09:31	RECON	Service account svc_backup used — backup privilege abused
11:22	PERSIST	net.exe executed — new user account creation attempt
11:55	ESCALATE	Impersonation privilege assigned — lateral movement to WS01
13:10	CRED DMP	mimikatz.exe detected — credential dumping in progress

14:02	STEALTH	admin_temp (unknown account) receives elevated privileges
15:00	CONFIRM	testuser role assignment confirmed — target of this hunt
16:44	SPREAD	john.doe account also receives security privileges — spreading

7. THREAT HUNTING REPORT

7.1 Executive Summary (100 Words)

On 30-03-2026, a threat hunt was conducted targeting MITRE ATT&CK T1078 (Valid Accounts — Privilege Escalation) originating from source IP 10.0.2.20. Elastic Security queries for Event ID 4672 identified 6 privilege escalation events across domain accounts including testuser, svc_backup, admin_temp, and john.doe. Velociraptor endpoint forensics detected mimikatz.exe execution and unauthorized net user commands. AlienVault OTX confirmed 10.0.2.20 is associated with T1078 threat intelligence pulses. The attack chain indicates credential dumping, lateral movement, and domain persistence. Immediate containment of 10.0.2.20 and account lockout of testuser and admin_temp is recommended

7.2 Technical Findings Summary

Finding	Count	Severity	Recommended Action
Event ID 4672 (Priv Escalation)	6 events	HIGH	Audit & revoke privileges
Affected User Accounts	4 accounts	HIGH	Force password reset + MFA
mimikatz.exe Detected	1 instance	CRITICAL	Isolate endpoint immediately
Unauthorized net user /add	1 attempt	HIGH	Review & delete new accounts
Encoded PowerShell (Base64)	1 instance	HIGH	Decode & analyse payload
OTX T1078 IOC Match (10.0.2.20)	12 pulses	HIGH	Block IP at perimeter firewall
admin_temp (Unknown Account)	1 account	CRITICAL	Delete account — investigate origin

7.3-Recommendations:

Immediate: Block 10.0.2.20 at perimeter firewall and internal VLAN
Immediate: Disable & investigate testuser, admin_temp, svc_backup accounts
Immediate: Isolate endpoint where mimikatz.exe was detected — full forensic image
Short-term: Enable MFA for all domain admin accounts and privileged users
Short-term: Deploy LAPS (Local Administrator Password Solution) on all workstations
Short-term: Create Elastic detection rule: alert on 3+ Event 4672 events within 5 min
Long-term: Implement Privileged Access Workstations (PAW) for admin tasks
Long-term: Regular threat hunts scheduled monthly with hypothesis documentation
Long-term: Integrate OTX TAXII feed into Elastic for automated IOC blocking
